| Bibliography | 22 |

1 | Goal

In this lab we will learn the basic principles of version control [git](#) [1].
To begin, we will install and configure Git on your machine see Section 2. As well as create accounts on [Github](#) [2] and [Hevs Gitlab](#) [3].
In Section 3 we learn the basic operations to be able to work with Git.
The created repository will then be published on [GitHub](#).
The advanced functions [branch](#) as well as [merge](#) will be tried in an example in Section 4.
In Section 5, we all work together using the gitflow principle.
Finally, there are some optional works in Section 6.

The answers to the questions should be written down in a Markdown file. The file should be named `answers.md`.

2 | Installation

The first step is to install Git as well as SublimeMerge.

2.1 git

You can download the latest version from the official website <https://git-scm.com/> [1]. Git is available for Linux, Mac, and Windows. This lab requires git \geq 2.27.

2.1.1 Command line

Start “Git Bash.” This is a Unix/Linux-like command editor that allows you to run Git commands in console mode. This is the interface we will use in this lab.

Figure 1: git Terminal

Note that for all commands in Git Bash, you can get help by inserting `--help` after the command.

```
git --help
```

2.1.2 Global configuration

A variety of settings can be configured in Git. It is possible to change the settings globally on your computer (flag `--global`) or only for a specific repository.

We will now perform the minimal configuration. Use the following commands to set your identity in Git globally on the system. Use your name and email address. This information is publicly visible to identify your work (your commits).

```
git config --global user.name "Firstname Lastname"
git config --global user.email first.last@email.ch
```

You can check the configuration with the following command:

```
git config --list
```

You can also check a specific setting:

```
git config user.name
```

2.2 Sublime Merge

Visit the website <https://www.sublimemerge.com> and download and install the Sublime Merge tool [4].

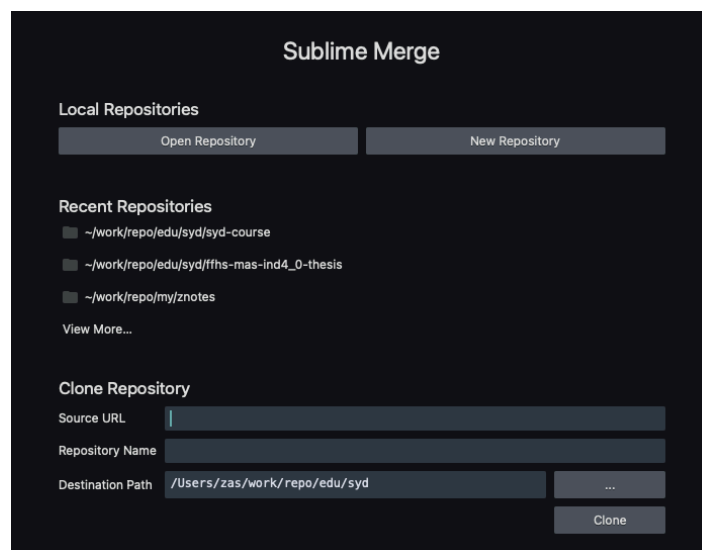

Figure 2: Sublime Merge GUI

2.3 Online accounts

2.3.1 Gitlab

Visit like website <https://gitlab.hevs.ch> and log in with your school account (SwitchEDU-ID).

Figure 3: Gitlab Login

2.3.2 Github

Visit like website <https://github.com> and create an account and log in.

Figure 4: GitHub Login

2.4 Windows Configuration

In order to see also the hidden `.git/` folder as well as file extensions. Configure your Windows File Explorer as follows Figure 5:

File Explorer ⇒ View ⇒ Show ⇒ Activate “**File name extensions**” and “**Hidden items**”

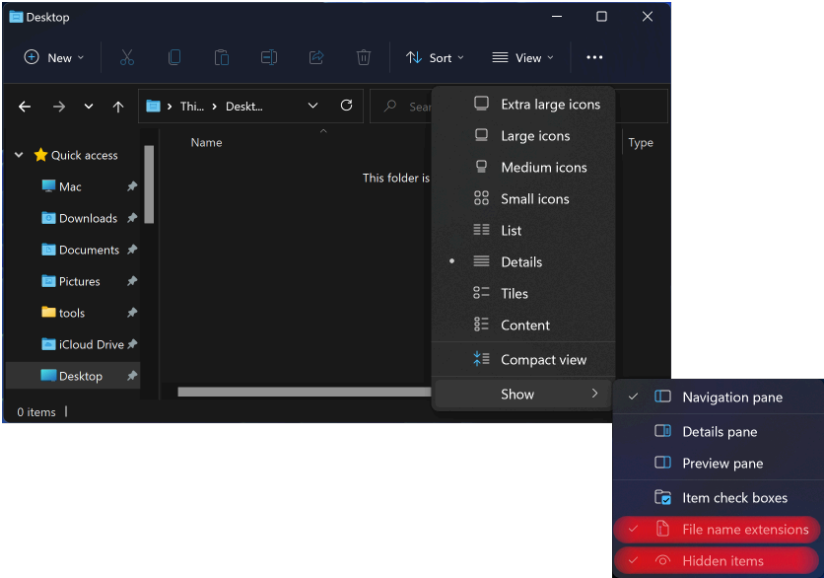

Figure 5: Windows File Explorer Configuration

3 | Basic operations

3.1 Create a git repository.

Using the Git Bash console, create an empty directory on your computer, for example `C:\temp\gitRepo` or `~/tmp/gitRepo`. This directory will be your git repository.

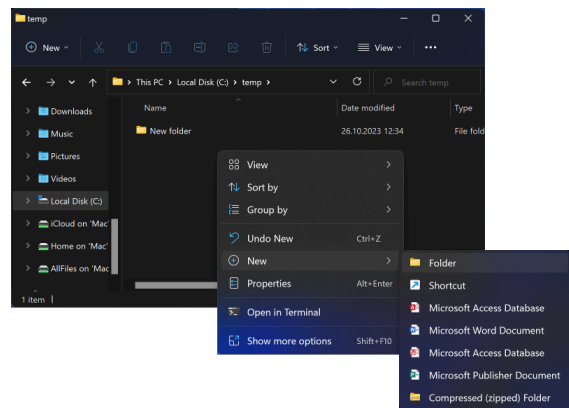

You can use the Unix/Linux commands `ls` (list files and directories), `cd` (change directory), `pwd` (print current working directory), and `mkdir` (make directory) to create this directory.

Commandline

```
mkdir -p c:/temp/gitRepo
cd c:/temp/gitRepo
```

GUI

`C:\temp` ⇒ New ⇒ Folder ⇒ gitRepo

3.2 Initialize

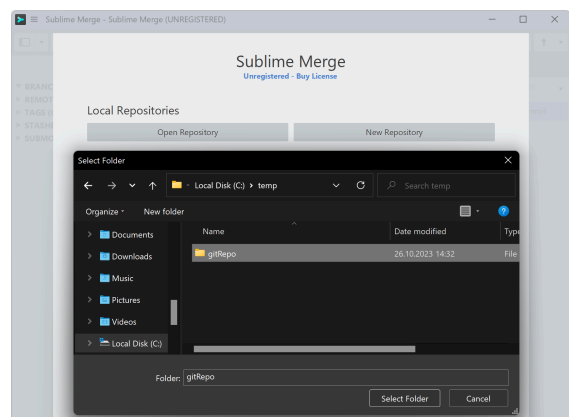

Once you are in that directory, initialize it as a git repo with the command:

Commandline

```
git init
```

GUI

`CTRL+T` ⇒ New Repository ⇒ Select Folder

What changed in the directory after you initialized it as a git repo?

Write down the answer!

3.3 Get status

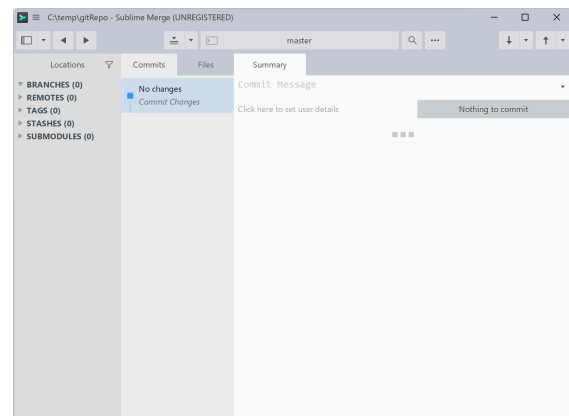

Get information about your repo with the following commands:

Commandline

```
git status
git log --oneline
```

GUI

See the status in the main window.

3.4 Add file

Now create an empty file named README.md in the root directory of your repo.

Commandline

```
touch README.md
```

GUI

C:\temp ⇒ New ⇒ Any File ⇒ README.md

Use the previous command to retrieve the information about your repo again. What has changed?

Write down the answer!

Your local git repo consists of three areas that are maintained by git:

- Working directory is a directory that contains the current version of your files (a normal file directory in the eyes of your operating system).
- Stage contains the changes to be included in the next commit;
- Head points to the location in the Git repo tree where the next commit should be made.

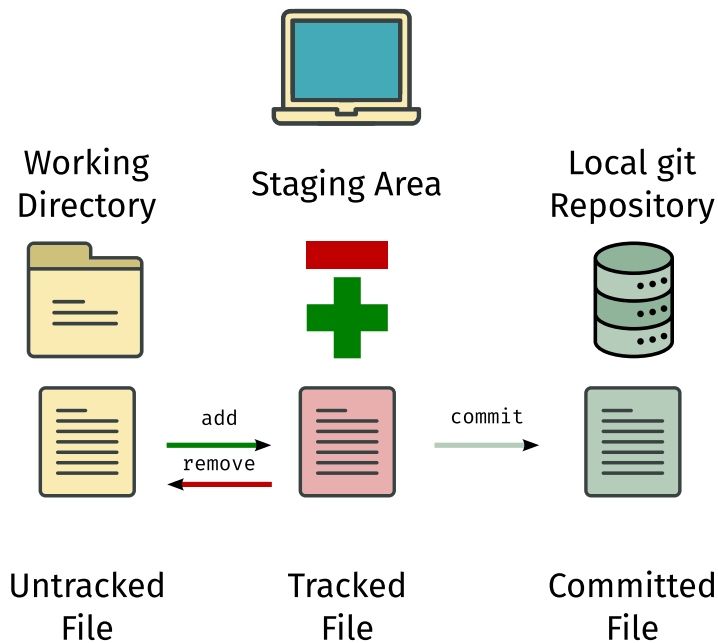

Figure 6: Types of local Git operations

A simple Git repo consisting of five commits can be represented as follows. The Head position is a reference to a commit that represents the current state/view of the repo, in this case the latest change.

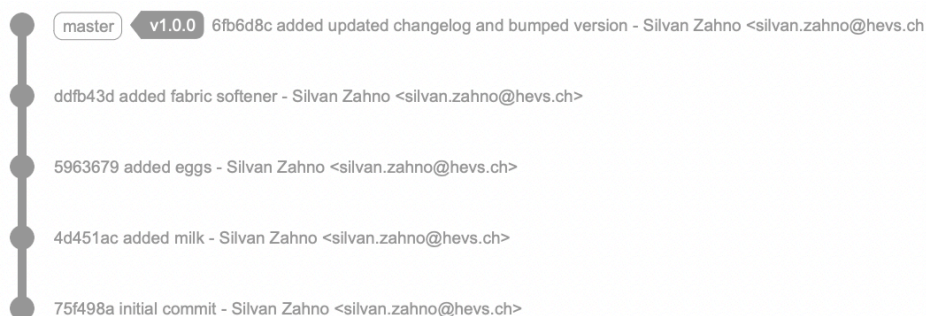

Figure 7: Five commits on the local repo, each commit has its own identification

3.5 Add file to repo

Add the previously created file README.md to the stage with the command:

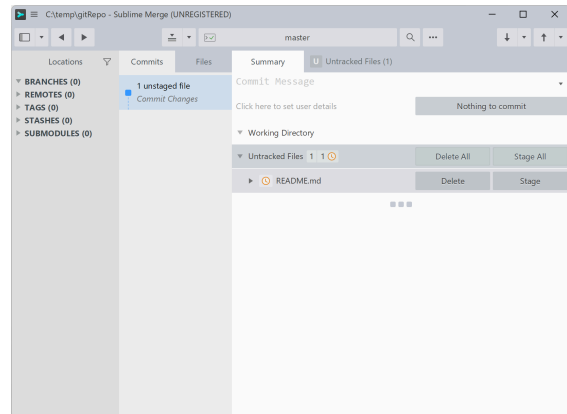

Commandline

GUI

Untracked Files \Rightarrow README.md \Rightarrow Stage

```
git add README.md
```

Retrieve the information about your repo again, what do you find?

Write down the answer!

Edit the file README.md with a texteditor and insert the following text (markdown syntax):

```
# Title of my readme
Text and more text, followed by a small list :
* Item 1
* Item 2
* Item 3

And finally a little code:
```sh
$ cd myDir
$ git init
$ git status
$ ls -al
```
```

Get the information about your repo again, what do you find?

Write down the answer!

3.6 Add new changes

Add the latest version of the README.md file to the stage.

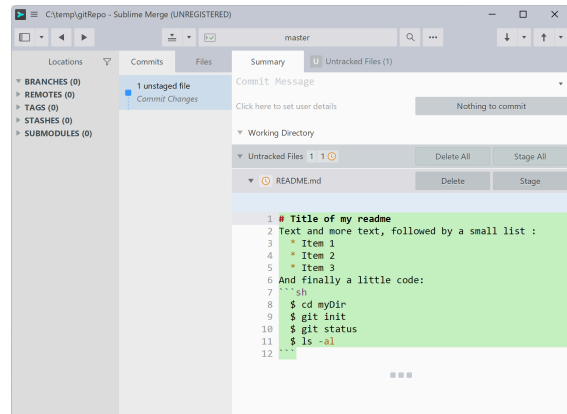

Commandline

GUI

Untracked Files ⇒ README.md ⇒ Stage

```
git add README.md
```

3.7 Execute commit

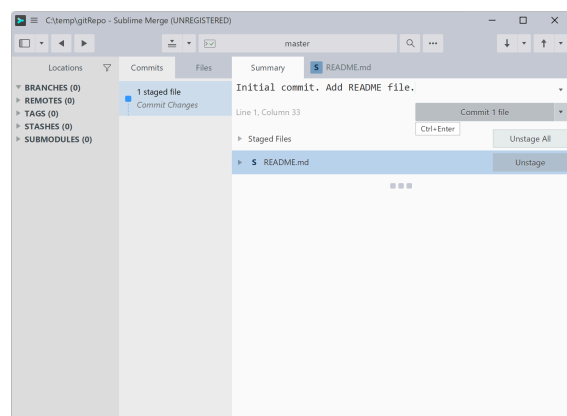

Now perform a commit with the following command:

Commandline

```
git commit -m "Initial commit. Add README file."
```

GUI

Commit Message ⇒ Initial commit. Add README file. ⇒ Commit 1 file

The `-m` option allows to specify the message of the commit directly. This message must be self-explanatory. It corresponds to the description of the changes. It is possible to insert a text block e.g. via a text editor without using the `-m` option.

Your changes are now published to your local git repo. Bravo.

3.8 More information

What information can you get now with the command:

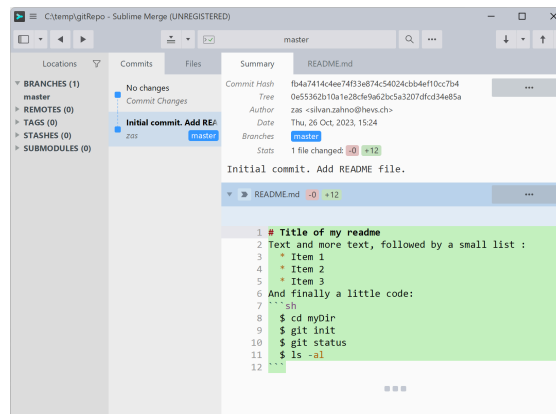

Commandline

GUI

Select First Commit ⇒ See all informations

```
git log --oneline
```

Clearly explain all the information in this line.

Write down the answer!

3.9 More commits

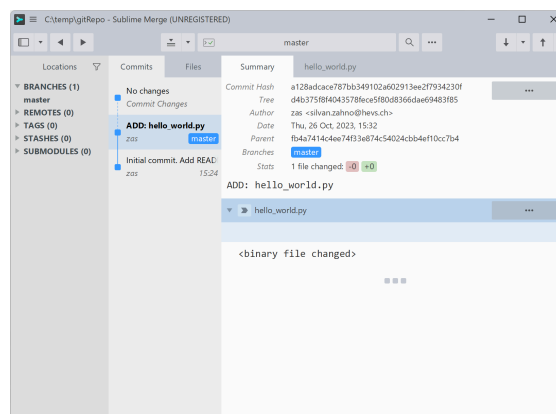

Perform another commit to add a new (empty) `hello_world.py` file to your repo.
Now what new information does the command give you:

Commandline

```
git log
```

GUI

Select Second Commit ⇒ See all informations

Write down the answer!

Note that each commit is provided with a “hash” or “checksum” (of type sha1). The hashes shown with the command:

```
git log --oneline
```

are only the first few characters of these so-called “short hashes”.

3.10 Checkout commit

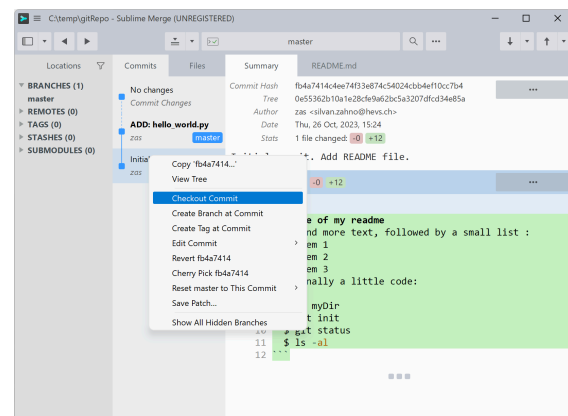

Now do a checkout with the following command using the “short hash”, which corresponds to your first commit.

Commandline

```
git checkout <SHA1> -b inspectingPrev  
# for example  
git checkout fb4a741 -b inspectingPrev
```

GUI

Select First Commit \Rightarrow Checkout commit

Now what do you notice when you call the contents of the working directory?

Write down the answer!

3.11 Checkout master

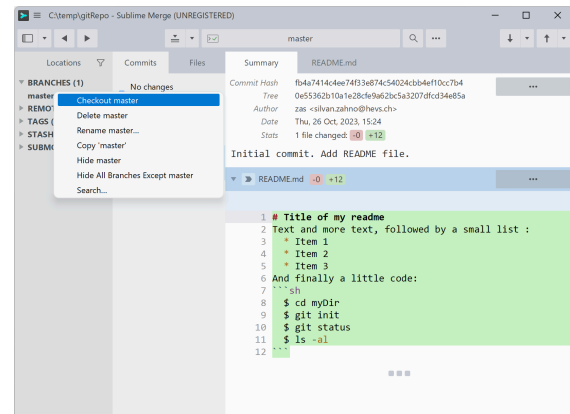

Now run a checkout with the following command:

Commandline

```
git checkout master
```

GUI

Branches (1) ⇒ master ⇒ checkout master

Now what do you notice when you look at the contents of the working directory?

Write down the answer!

4 | Branch and Merge

So far we have used the basic functions of Git. There are also the branch and merge functions, which Git has greatly simplified compared to the tools that existed earlier.

For this hands-on work, you can use the Sublime Merge GUI, which gives you a graphical representation and visual history of the commits in your repo.

1. Create a Github repo and add it as a remote

Create a new repository

A repository contains all project files, including the revision history. Already have a project repository elsewhere? [Import a repository.](#)

Required fields are marked with an asterisk (*).

Repository template

No template

Start your repository with a template repository's contents.

Owner *

tschinz

Repository name *

gitRepo

gitRepo is available.

Great repository names are short and memorable. Need inspiration? How about [stunning-octo-bassoon](#)?

Description (optional)

test repo for course SyD

☒ Public

Anyone on the internet can see this repository. You choose who can commit.

☐ Private

You choose who can see and commit to this repository.

Initialize this repository with:

☐ Add a README file

This is where you can write a long description for your project. [Learn more about READMEs.](#)

Add .gitignore

.gitignore template: None

Choose which files not to track from a list of templates. [Learn more about ignoring files.](#)

Choose a license

License: None

A license tells others what they can and can't do with your code. [Learn more about licenses.](#)

You are creating a public repository in your personal account.

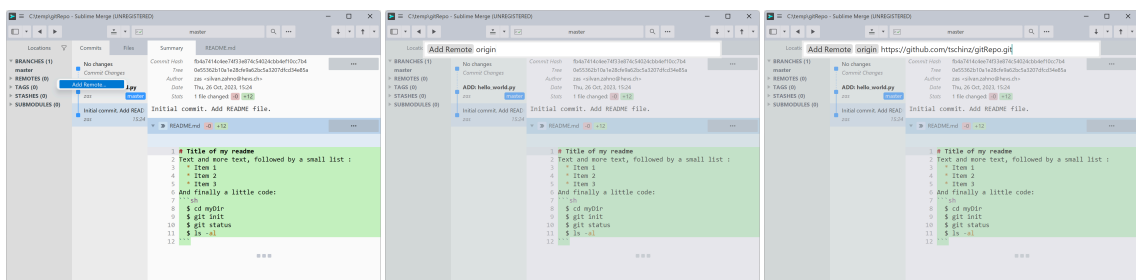

Create repository

Commandline

```
git remote add origin https://github.com/<username>/<reponame>.git
```

GUI

Remotes (0) ⇒ Add Remote... ⇒ Remote name ⇒ origin ⇒ Remote URL ⇒ https://github.com/<username>/<reponame>.git

2. Create a development branch dev01 in your local repo.
3. Create two commits on this branch:
 - One to create a file hello_world.py (This commit already exists).
 - One to populate this file hello_world.py.

```
print("Hello, world!")
```

4. Checkout the master branch
5. From the master branch, create a new development branch dev02.
6. Edit the README.md file and create a commit on the branch dev02.
7. Merge the branch dev02 into master.
 - Checkout the master branch
 - Perform a merge “merge dev02 into master”
8. Merge the branch dev01 into master.
 - Checkout the master branch
 - Perform a merge “merge dev01 into master”
9. Push your local repository to your GitHub remote.

```
git push origin master
```

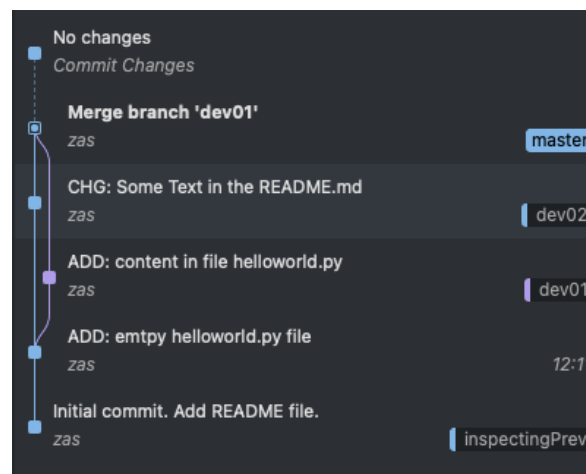

Figure 9: Status after repo branches dev01 and dev02 have been merged

5 | Gitflow

For this task, use the Gitflow philosophy presented in the course. You will all collaborate on the following Git repo as if you were forming a development team:

<https://github.com/tschinz/gitflow> [5]

This is a public Git repo hosted on Github.

5.1 Fork

For security reasons, you are not allowed to work directly on this repository. You need to create your own copy (fork) in order to make changes. Therefore, please create a “fork” of this repository in your GitHub account. To do this, use the “Fork” button in the Github web interface.

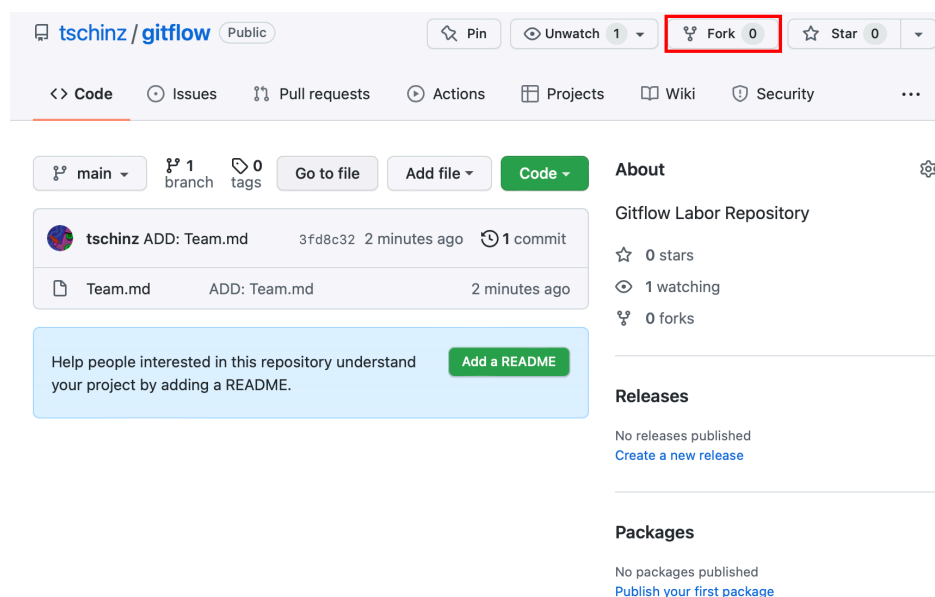

Figure 10: Fork button for a GitHub repository

Next, clone our shared repository. The URL of your repository will look similar to:

```
git clone https://github.com/<username>/gitflow.git
```

5.2 Parallel collaboration

In a local feature branch, edit the `Team.md` file. Replace your given number with your first name and last name.

You will all edit the same file. To avoid conflicts, edit only the line that is relevant to you.

“Commit” and “push” your branch to the fork repository on GitHub.

5.3 Pull Request

Create a “pull request” (merge request) on GitHub. Use the interface on the GitHub website to do this.

Once all pull requests are ready, merges will be done in consultation with the entire group (and teachers).

6 Extras

This optional chapter can be started provided the previous tasks have been completed. There are 2 tasks to do:

1. Put your own project on Github and provide it with a `README.md` and a CI/CD.
2. Follow the “Learn Git Branching” website

6.1 Own project

- Put a current project you are working on, on github.
- Create a `README.md` file for the project using the [Markdown Syntax](#). The `README.md` should include the following:
 - Title
 - Image
 - Description of the project
 - Explanation how to run / use the project
 - List of authors
- Now create a github action to turn the `README.md` into a PDF on every push. For this find a suitable [github action](#) and add it to your project.

If you need help to create the github actions. Checkout the following [hint](#).

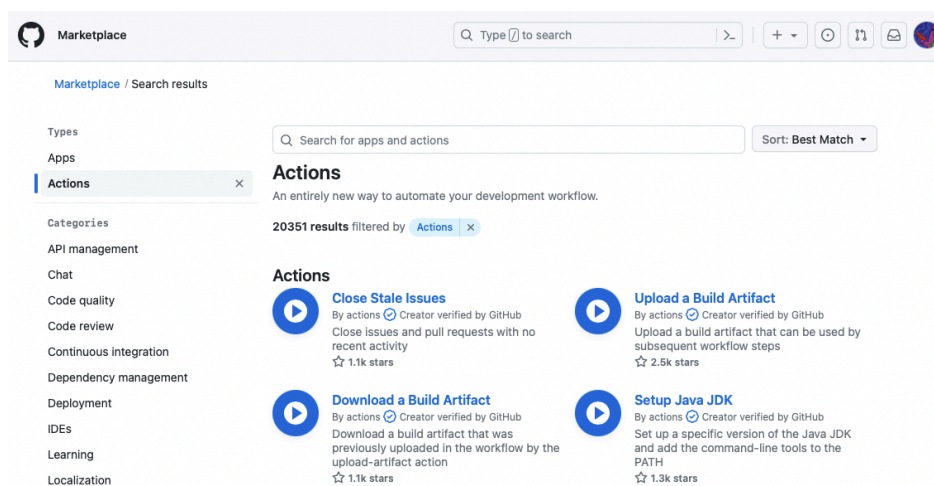

Figure 11: Github Action Marketplace

6.2 Learn Git Branching

Follow the Tutorial on <https://learngitbranching.js.org>.

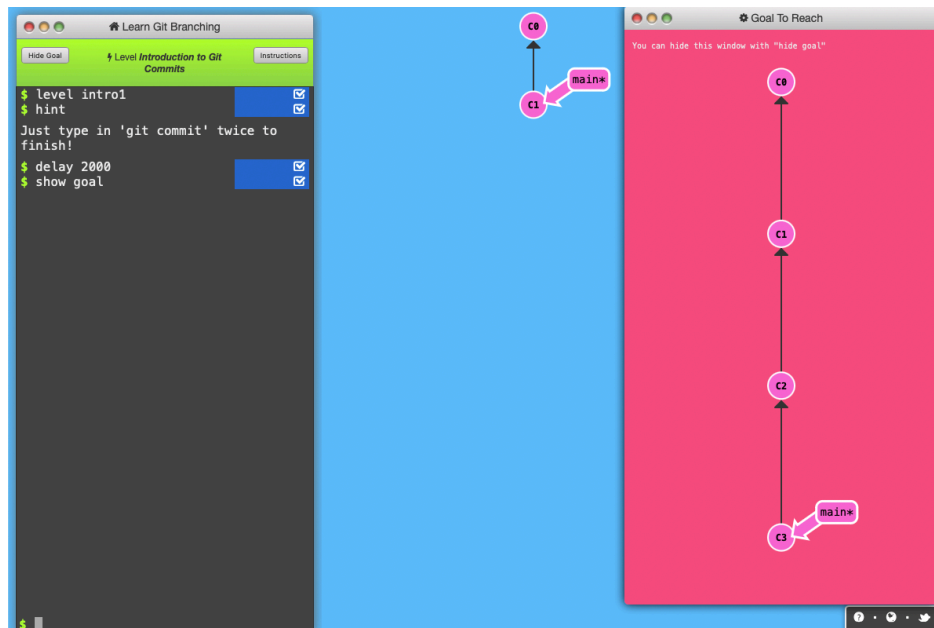

Figure 12: Learn git branching website

A | GIT commands

[Github git cheatsheet](#) [6], [7]

AA Review changes and make a commit transaction.

```
git status
```

Lists all new or changed files ready for commit.

```
git diff
```

Displays file changes that have not yet been indexed.

```
git add [file]
```

Indexes the current state of the file for versioning.

```
git diff --staged
```

Shows the differences between the index (“staging area”) and the current file version.

```
git reset [file]
```

Takes the file from the index, but preserves its contents.

```
git commit -m "[descriptive message]"
```

Adds all currently indexed files permanently to the version history.

AB Synchronize changes

Register an external repository (URL) and swap the repository history.

```
git fetch [remote]
```

Downloads the entire history of an external repository.

```
git merge [remote]/[branch]
```

Integrates the external branch with the current locally checked out branch.

```
git push [remote] [branch]
```

Pushes all commits on the local branch to GitHub.

```
git pull
```

Pulls the history from the external repository and integrates the changes.

B | Most used Git commands

BA Start a working area

- `clone` - Clone a repository into a new directory
- `init` - Create an empty Git repository or reinitialize an existing one

BB Work on the current change

- `add` - Add file contents to the index
- `mv` - Move or rename a file, a directory, or a symlink
- `reset` - Reset current HEAD to the specified state
- `rm` - Remove files from the working tree and from the index

BC Examine the history and state

- `log` - Show commit logs
- `show` - Show various types of objects
- `status` - Show the working tree status

BD Grow, mark and tweak your common history

- `branch` - List, create, or delete branches
- `checkout` - Switch branches or restore working tree files
- `commit` - Record changes to the repository
- `diff` - Show changes between commits, commit and working tree, etc
- `merge` - Join two or more development histories together
- `rebase` - Reapply commits on top of another base tip
- `tag` - Create, list, delete or verify a tag object signed with GPG

BE Collaborate

- `fetch` - Download objects and refs from another repository
- `pull` - Fetch from and integrate with another repository or a local branch
- `push` - Update remote refs along with associated objects
